

Beam!

Share any files, in full quality – phone to phone, phone to PC, PC to PC. No cloud, no accounts, no limits.

What is Beam!?

Beam sends your files directly from one device to another over the BitTorrent network. Your photos and videos arrive in their **original quality**, because they never pass through a messenger that recompresses them. You share a small **.beam** link (for example via WhatsApp), and the file travels device-to-device.

One link, many receivers: as long as the sender stays online, the same .beam link can be downloaded by as many people – and devices – as you like.

Sending a file

- In any app, tap **Share** and choose **Beam!**.
- Optional: for large videos you can reduce the quality/size first.
- Optional: turn on the **lock** to encrypt with a passphrase (see Encryption).
- Beam creates a small **.beam** file – send it to your friend with any app (WhatsApp, email, ...).
- Keep the sending device **awake and online** until the receiver is done – it serves the data.

Receiving a file

- Tap the received **.beam** file – Beam opens and the download starts automatically.
- If your file manager does not offer Beam, open Beam and use the **Import** button (bottom-left) to pick the .beam file.
- You can also paste a copied link with **Paste link**.
- Photos and videos go to your **gallery**; documents go to **Download/Beam**.

The activity-card buttons

- **Copy link** – copy the link to use in other torrent apps.
- **Reshare** – invite more people to download the same file.

- **Restart** – fully restart a stuck transfer (e.g. after a network change). Same effect as deleting and re-opening the link, but without losing progress.
- **Hourglass** – nothing to open yet.
- **Play** – play a finished video, or stream a single video while it downloads.
- **Open** – open the gallery (for media) or the Download/Beam folder (for documents).
- **Delete** – remove everything, including the received file(s).
- **Remove card** – keep the files, just clear the card.

Encryption

Tap the **lock** in the bar at the top and enter a passphrase before sending. The file is end-to-end encrypted, and the receiver must enter the **same passphrase** to open it. Encrypted videos cannot be streamed during download – they are decrypted only once complete.

Sending several files at once (bundles)

Select multiple files and share them to **Beam!** – they travel as a single **.beam**. The receiver gets them all back as individual files. This works both on the phone and in the PC version.

Faster and more reliable

- **Best speed:** put both devices on the same Wi-Fi, or use one phone's hotspot and connect the other to it – this avoids the router bottleneck.
- Over **mobile data** a direct connection is not always possible (carrier NAT); same Wi-Fi is the most reliable.
- Turn **off battery optimization** for Beam (on Xiaomi/MIUI also enable "Autostart").
- On mobile data, disable **"Data Saver"** for Beam, otherwise transfers get throttled.
- Keep the sending device **awake/charging** until the receiver is finished.
- If a transfer seems stuck, tap **Restart**.

Settings

- **Trackers** – help sender and receiver find each other. Both should use the same trackers (the defaults work).
- **Connectivity** – after how many seconds Beam may switch to μ TP for better connectivity.
- **Share Beam!** – send the app itself to friends so they can install it.
- **Clean up temp files** – free space by removing leftover temporary files. Your received files are never touched.

Beam! on Windows (PC)

Install Beam on Windows with the provided installer (**Beam-x.x.x.msi**) – no Java needed.

- **Send:** select one or more files, right-click, then **Send to -> BEAM!**, and share the created .beam further.
- **Receive:** open a .beam file (e.g. from WhatsApp on the PC) – files download to your **Downloads\Beam** folder, which opens automatically when done.
- The same .beam link works across **phone and PC**, and for several receivers at once.

Privacy

Your file goes straight from device to device – no server ever sees its contents. With encryption on, even the file name is hidden, and only someone with your passphrase can open it.
